

## Site Map Reflection – Arngren.net

The current structure of Arngren.net contains product categories, but they are not clearly communicated to users. The homepage presents hundreds of product links at once, with no visual hierarchy or grouping, making it difficult to understand how the site is organized. While categories such as electric vehicles, toys, and electronics exist, they are mixed together without clear navigation cues.

Creating the sitemap helped reveal that the site has a relatively flat structure, with most pages linked directly from the homepage rather than through a logical category system. This makes the site overwhelming and difficult to navigate, especially for new users. Important navigation elements are buried among product listings, which prevents users from forming a clear mental model of how the site works.

For future improvement, I am thinking about introducing a clear top-level navigation with consistent categories, reducing the number of links shown on the homepage, and grouping related products into dedicated sections. This would improve usability, reduce cognitive load, and make the site easier to browse.
