

W11A2 Figma wireframes

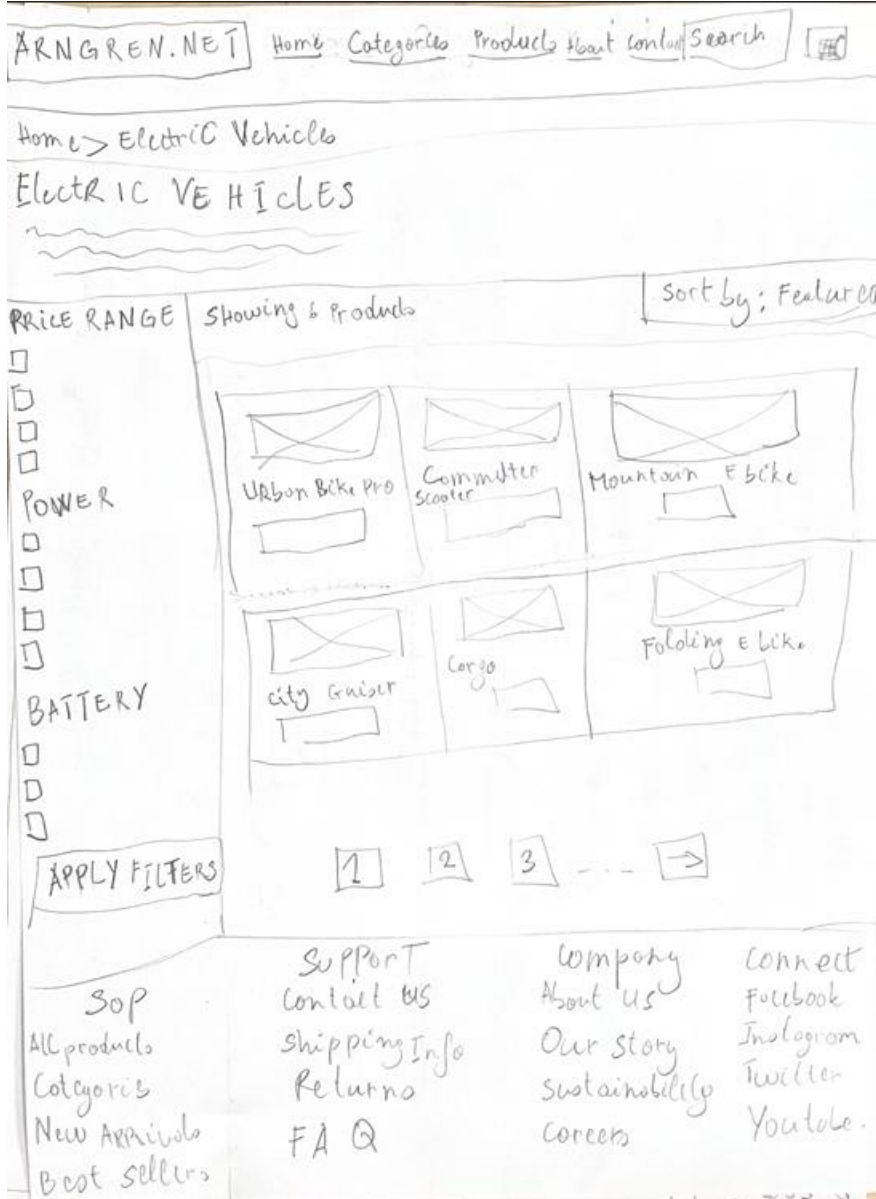

Sketch

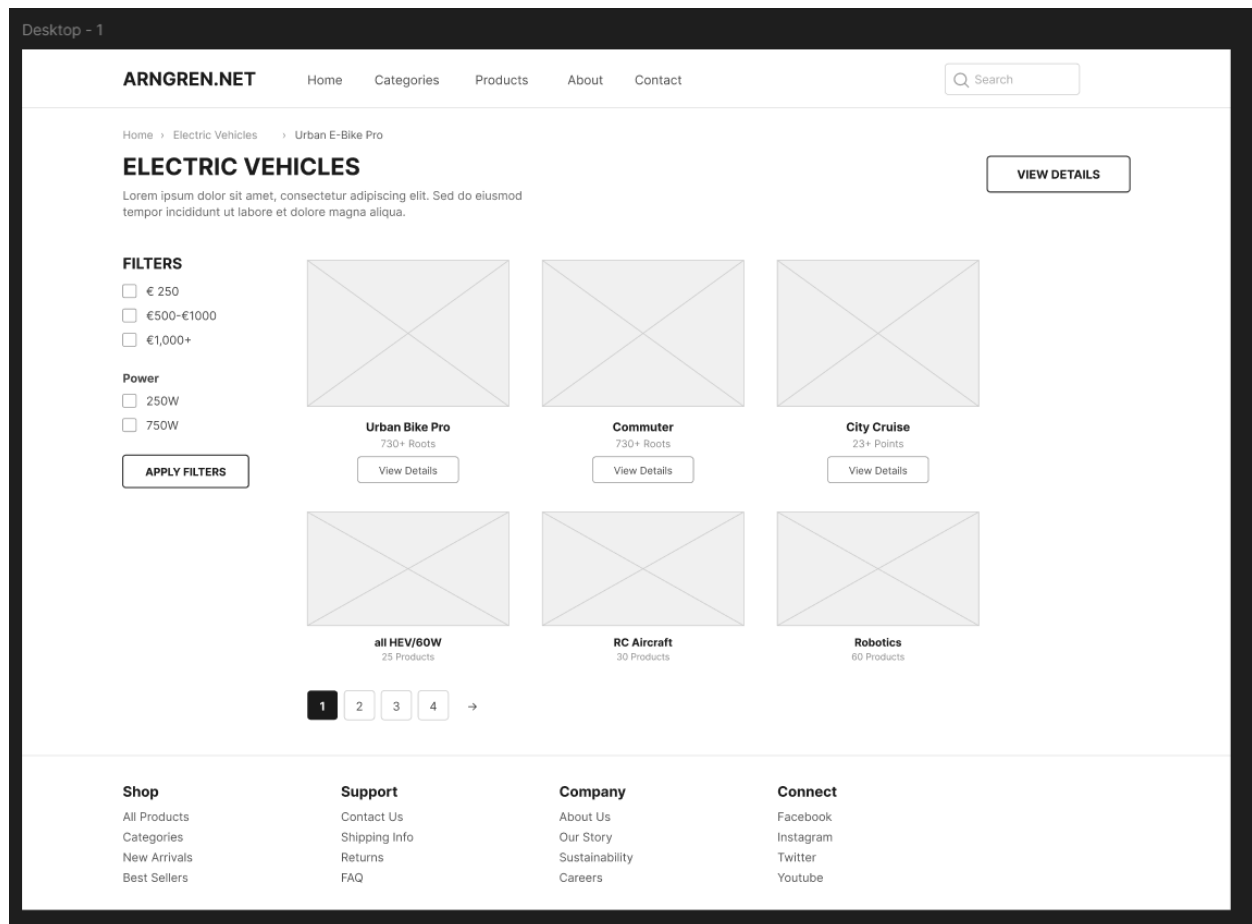

Wireframe:

Product listing sketch:

Product listing wireframe:

For the Arngren.net wireframes, I used Figma with the Material3 design UI kit to create clean, functional layouts that prioritize user experience over visual design.

My process began with creating reusable components for the navigation and footer, ensuring consistency across all pages. I then built each page based on my hand-drawn storyboards from W10A1, making minor refinements to spacing and alignment. The main changes from sketch to digital were the removal of underlining on the navigation bar words; for the products listed on the main page, I added an extra box right below the image for item count.

Working in Figma revealed opportunities to improve the original designs. The digital wireframes also helped me ensure all touch points and user interactions were accounted for.

Overall, the transition from hand-drawn to digital wireframes strengthened my design by allowing me to actually build and feel what a normal user would see from their day-to-day usage basis.
